

Removing Spilt PnF Paint

It happens, right!

So how do you deal with it?

First Steps:

Stop further spills or tracking off your shoes etc.

For a fresh paint spill, act immediately by scooping up as much as possible with cardboard, then blotting with rags or sand.

For water-based paint, (PnF Primer - Sealer) use detergent and warm water.

For solvent-based paint, (PnF FP or PP) use the recommended thinners and lots of rags. Try not to spread. Can also use sand to absorb a lot.

If already dry, scrape it off hard surfaces using a scraper or putty knife. Never pour paint down the drain.

If more action is needed, then consider:

- 1 Eco Safe Strip – Bunnings

2. A Methylene Chloride Paint Stripper. (Bunnings have several brands - Diggers, Poly etc.) Note: this is very aggressive and needs to be handled with care. Eye and hand protection is a must.

BE READY – Have a Spill Kit on hand always.

Spills happen and usually at the worst moment so have in your truck or on hand:

- A supply of both paint removers.
- A bag of sand
- Lots of rags
- Several large heavy duty plastic bags
- Safety glasses, gloves etc

Be Prepared for When Shxt Happens, as always it does.
